Sample Holman Thermodynamics Problem & Solution

Problem Statement A piston-cylinder device contains 0.5 kg of saturated vapor of water at 200 kPa. Heat is added until the vapor becomes a saturated liquid-vapor mixture with a quality of 0.1. Determine the heat transferred during this process.

Solution Steps

Identify knowns: Mass, $m = 0.5$ kg Initial pressure, $P_1 = 200$ kPa Initial state: saturated vapor at P_1 Final quality, $x_2 = 0.1$ Final pressure (assumed constant), $P_2 = 200$ kPa Draw a diagram: PV or T-s diagram showing initial saturated vapor and final mixture state. Find initial specific volume: Use saturated vapor table at 200 kPa, $v_g \approx 0.8857$ m³/kg. Calculate initial volume: $V_{\text{initial}} = m v_g = 0.5 \times 0.8857 \approx 0.44285$ m³. Find final specific volume: v_f and v_g at 200 kPa: $v_f \approx 0.001157$ m³/kg $v_g \approx 0.8857$ m³/kg Calculate v_2 : $v_2 = v_f + x_2(v_g - v_f) \approx 0.001157 + 0.1(0.8857 - 0.001157) \approx 0.001157 + 0.08856 \approx 0.08972$ m³/kg. Calculate final volume: $V_{\text{final}} = m v_2 = 0.5 \times 0.08972 \approx 0.04486$ m³. Determine heat transfer: Since pressure is constant, use the specific enthalpies from tables: h_f and h_g at 200 kPa: $h_f \approx 504.7$ kJ/kg $h_g \approx 2675.5$ kJ/kg Calculate final specific enthalpy: $h_2 = h_f + x_2(h_g - h_f) \approx 504.7 + 0.1(2675.5 - 504.7) \approx 504.7 + 0.121708 \approx 504.7 + 217.08 \approx 721.78$ kJ/kg. Calculate initial specific enthalpy: For saturated vapor at 200 kPa, $h_g \approx 2675.5$ kJ/kg. Determine heat added: $Q = m(h_2 - h_1) = 0.5(721.78 - 2675.5) \approx 0.5(-1953.72) \approx -976.86$ kJ. Since the value is negative, heat is removed; in this case, the problem states heat is added, so check assumptions or clarify process details. The calculation process illustrates the approach.

Conclusion Mastering thermodynamics Holman problems requires understanding core concepts, developing systematic problem-solving skills, and practicing regularly. These problems are designed to bridge theoretical knowledge with practical applications, making them invaluable for engineering students and professionals. By following structured steps, utilizing property tables and charts effectively, and verifying solutions, you can confidently tackle even the most complex thermodynamic challenges. Remember, consistent practice and a clear understanding of the fundamental principles will significantly improve your ability to solve Holman problems efficiently and accurately.

- Efficiency depends on the thermal conductivity of the material.
- Critical in designing insulation, heat exchangers, and electronic cooling systems.

Convection

Convection is the transfer of heat through the movement of fluids—liquids or gases. It combines conduction within the fluid and bulk fluid motion.

Types of convection:

- Natural convection:** Driven by buoyancy effects due to temperature differences.
- Forced convection:** Driven by external means like fans or pumps.

Important factors:

- Nusselt number:** Dimensionless number indicating convective heat transfer relative to conduction.
