Sample Finance Aptitude Questions with Answers

1. Basic Financial Mathematics
Question: If the price of a stock increases from \$50 to \$60, what is the percentage increase?
Answer: To calculate the percentage increase:

$$\text{Percentage Increase} = \left(\frac{\text{New Price} - \text{Old Price}}{\text{Old Price}} \right) \times 100$$

$$= \left(\frac{60 - 50}{50} \right) \times 100 = \left(\frac{10}{50} \right) \times 100 = 20\%$$
 Therefore, the stock price increased by 20%.
2. Financial Ratios and Analysis
Question: A company's current assets are \$150,000, and current liabilities are \$50,000. What is the current ratio?
Answer: Current ratio is calculated as:

$$\text{Current Ratio} = \frac{\text{Current Assets}}{\text{Current Liabilities}} = \frac{150,000}{50,000} = 3$$
 The company's current ratio is 3:1, indicating good short-term liquidity.
3. Time Value of Money
Question: What is the future value of \$1,000 invested at an annual interest rate of 8% compounded annually for 3 years?
Answer: Using the future value formula:

$$FV = PV \times (1 + r)^n$$

$$FV = 1000 \times (1 + 0.08)^3 = 1000 \times (1.08)^3 \approx 1000 \times 1.2597 \approx \$1,259.72$$
 The future value is approximately \$1,259.72.
4. Profit and Loss Calculations
Question: A trader buys 100 shares at \$40 each and sells them at \$55 each. What is the total profit?
Answer: Total profit:

$$\text{Profit per share} = 55 - 40 = 15$$

$$\text{Total profit} = 15 \times 100 = \$1,500$$
 The trader makes a total profit of \$1,500.
5. Banking and Investment Concepts
Question: What is the difference between simple interest and compound interest?
Answer: Simple Interest: Calculated only on the principal amount for the entire period. Formula: $(SI = P \times r \times t)$. Compound Interest: Calculated on the principal and accumulated interest from previous periods. Formula: $(FV = P \times (1 + r)^t)$. Key distinction: Compound interest grows faster over time as interest earns interest.
6. Data Interpretation and Graphs
Question: Given a bar graph showing quarterly sales figures, how would you identify the quarter with the highest sales?
Answer: Examine

the heights of the bars. The tallest bar represents the quarter with the highest sales. Note the specific quarter label to record the answer. Tip: Always cross-verify with the data labels if available.

7. Logical and Analytical Reasoning Question: If all finance managers are analysts, and some analysts are auditors, can we conclude that some finance managers are auditors? Answer: No, the conclusion cannot be definitively drawn based on the given information. The relationships are: All finance managers are analysts ($F \rightarrow A$). Some analysts are auditors ($A \rightarrow \text{Auditors} \rightarrow ?$). However, this does not necessarily imply that some finance managers are auditors, as the subset of analysts who are auditors may not include any finance managers.

Sample Questions and Detailed Solutions To understand the nature of finance aptitude questions, let's examine some typical examples across various categories, along with step-by-step solutions.

Question 1: Simple Interest Calculation
Question: A sum of \$5,000 is invested at an annual simple interest rate of 6%. What will be the interest accrued after 3 years?
Solution: Simple Interest (SI) is calculated as: $SI = (\text{Principal} \times \text{Rate} \times \text{Time}) / 100$
 Applying the values: $SI = (5000 \times 6 \times 3) / 100$
 $SI = (5000 \times 18) / 100$
 $SI = 90000 / 100$
 $SI = \$900$
Answer: The interest accrued after 3 years is \$900.

Question 2: Compound Interest Calculation
Question: What will be the amount after 2 years if \$1,000 is invested at an annual compound interest rate of 8%, compounded annually?
Solution: Compound Amount (A) is given by: $A = P(1 + r/100)^t$
 Where: $P = 1000$, $r = 8$, $t = 2$
 Calculating: $A = 1000 \times (1 + 8/100)^2$
 $A = 1000 \times (1.08)^2$
 $A = 1000 \times 1.1664$
 $A = \$1,166.40$
Answer: The amount after 2 years will be \$1,166.40.

Question 3: Profit and Loss Problem
Question: A shopkeeper sells an article at a profit of 20%. If the selling price is \$240, what is the cost price?
Solution: Profit percentage (P%) = $(\text{Profit} / \text{Cost Price}) \times 100$
 Given: Selling Price (SP) = \$240
 Profit = 20% of Cost Price (CP)
 Since $SP = CP + \text{Profit}$, Profit = 20% of CP = $0.20 \times CP$
 Therefore, $SP = CP + 0.20 \times CP = 1.20 \times CP$
 Rearranged: $CP = SP / 1.20 = 240 / 1.20 = \200
Answer: The cost price is \$200.

Question 4: Discount and Marked Price
Question: A retailer offers a 10% discount on an article marked at \$150. What is the selling price after discount?
Solution: Discount amount = 10% of marked price = $0.10 \times 150 = \$15$
 Selling Price (SP) = Marked Price - Discount = $150 - 15 = \$135$
Answer: The selling price after discount is \$135.

Question 5: Ratio and Proportion in Financial Context
Question: The ratio of current assets to current liabilities of a company is 3:1. If current liabilities are \$50,000, what are the current assets?
Solution: Current Assets (CA) / Current Liabilities (CL) = 3 / 1
 Given CL = \$50,000, $CA = (3 / 1) \times 50,000 = 3 \times 50,000 = \$150,000$
Answer: Current assets amount to \$150,000.
